No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                     Score

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Vascular endothelial growth factor A precursor permeability factor) (VPF).
                                             Miura N., Misumi K., Kawahara K., Nakashima M., Fukumitsu S.,
Kawabata H., Uto N., Oka T., Maruyama I., Sakamoto H.;
"Cloning of cDNA and high-level expression of equine vascular
endotherial growth factor (VEGF).";
Submitted (JAN-2001) to the EMBL/GenBank/DDBJ databases.
-i-FUNCTION: Growth factor active in angiogenesis, and endothelial
cell growth. Induces endothelial proliferation and vascular
permeability (By similarity).
-i-SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer
                                                                                                                                                                                                                                                                                                                                 VEGA HOP

                                                                        FUNCTION: Growth factor active in angiogenesis, vasculogenesis endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and
                 with PIGF (By similarity).
SUBCELLULAR LOCATION: Secreted but
                                              heparin (By similarity).
SUBUNIT: Homodimer; disulfide-linked. Also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              147

Vascular endothelial growth factor A precursor (VEGF-A) (Vascular permeability factor) (VPF).
Submitted (NOV-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits appropriate, and induces permeabilization of blood vessels. It binds to the VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and

mitted (MAR-1999) to the EMBL/GenBank/DDBJ databases.
FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and heparin (By similarity).
SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer with PIGF (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      IsoId=Q9MYV3-3; Sequence=VSP 004615, VSP 004616; SIMILARITY: BELONGS TO THE PDGF/VEGF FAMILY OF GROWTH FACTORS.

Also found in bronchial epithelium, adrenal gland and in seminiferous tubules of testis. High expression of vegor continues in kidney glomeruli and choroid plexus in adults.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDLINE=96216498; PubMed=8632007;

It induces endothelial cell proliferation, promotes cell migration, inhibite apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and

Biol. Chem. 270:7717-7723(1995).

-i- FUNCTION: Growth factor active in angiogenesis, vasculogenesis a endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFRI/Fit-1 and VEGFRI/Fit-1 are receptors and to heparan sulfate and

                                                                   VARSPLIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      VEGF-A164 is more basic, has heparin-binding properties and, although a signicant proportion remains cell-associated, most is freely secreted. VEGF-A188 is very basic; it is cell-associated after secretion and is bound avidly by heparin and the extracellular matrix, although it may be released as a soluble form by heparin, heparinase or plasmin (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer with PIGF (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MEDLINE=98035455; PubMed=9351807
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             X-RAY CRYSTALLOGRAPHY (1.93 ANGSTROMS)
                                                                                                                    with PIGF (By similarity).

SUBCELLULAR LOCATION: VEGF121 is acidic and freely secreted.

VEGF165 is more basic, has heparin-binding properties and,
although a signicant proportion remains cell-associated, most
freely secreted. VEGF189 is very basic; it is cell-associated
after secretion and is bound avidly by heparin and the
extracellular matrix, although it may be released as a soluble
form by heparin, heparinase or plasmin.
                                                                                                                                                                                                                                                                        FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Fit-1 and VEGFR2/Kdr receptors and to heparan sulfate and heparin. Neuropilin-1 binds isoforms VEGF-165 and VEGF-145. SUBUNIT: Homodimer; disulfide-linked. Also found as heterodimer

Dev. Biol. 169:699-712(1995).

-!- FUNCTION; Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFRI/Flt-1 and VEGFRI/Flt
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Flamme I., von Reutern M., Drexler H.C., Syed-Ali S., Risave Overexpression of vascular endothelial growth factor in the embryo induces hypervascularization and increased vascular permeability without alterations of embryonic pattern formalized. 171:399-414 (1995).

Expression of VEC only from day 2.
DOMAIN: VEGF-190 contains a basic insert which
                                                                                                                                                                                                                                                                                                                                                                                                                                                             IsoId=P52582-3; Sequence=VSP_004635, VSP 004636;
Note=Has been shown to exist only in quail so far;
TISSUE SPECIFICITY: Abundantly and equally expressed in h
liver. In kidney glomeruli, brain and yolk sac, VEGF-166
10-times more abundant than VEGF-190.
DEVELOPMENTAL STAGE: VEGF-166 is expressed early at day 1
upgraded during gastrulation. Expression of VEGF-190 is d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            heparin (By similarity).
SUBUNIT: Homodimer; disulfide-linked. Also found
with PIGF (By similarity).

-!- FUNCTION: Growth factor active in angiogenesis, and endothelial cell growth, stimulating their proliferation and migration and also has effects on the permeability of blood vessels. May function in angiogenesis of the venous and lymphatic vascular systems during embryogenesis, and also in the maintenance of differentiated lymphatic endothelium in adults. Binds and activates VEGFR-2 (Flk1) and VEGFR-3 (Flt4) receptors.

-!- SUBUNIT: Homodimer; non-covalent and antiparallel.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Spleen, lymph node, thymus, appendix, bone colon and small intestine and fetal liver, lung and kidney, but not in peripheral blood lymphotyte.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Joukov V., Sorsa T., Kumar V., Jeltsch M., Claesson-Welsh L., Cao Y., Saksela O., Kalkkinen N., Alitalo K.; "Proteolytic processing regulates receptor specificity and activity o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PTM: Undergoes a complex proteolytic maturation which generates a variety of processed secreted forms with increased activity toward VEGFR-3, but only the fully processed form could activate VEGFR-2. VEGF C first form an antiparallel homodimer linked by disulfide bonds. Before secretion, a cleavage occurs between arg-227 and ser-228 producing an heterotetramer. The next extracellular step of the processing removes the N-terminal propeptide. Finally the mature VEGF-C is composed mostly of two VEGF homology domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    European Bioinformatics Institute.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (VHDs) bound by non-covalent interactions. SIMILARITY: BELONGS TO THE PDGF/VEGF FAMILY OF GROWTH FACTORS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SWISS-PROT entry is copyright.                                                                                                                                                   cell growth, stimulating their proliferation and migration and also has effects on the permeability of blood vessels. May function in angiogenesis of the venous and lymphatic vascular systems during embryogenesis, and also in the maintenance of differentiated lymphatic endothelium in adults. Binds and activates VEGFR-2 (Flk1) and VEGFR-3 (Flt4) receptors. SUBUNIT: Homodimer; non-covalent and antiparallel. SUBCELIULAR LOCATION: Secreted.
                                                                                      postimplantation embryos, particularly in the regions where the lymphatic vessels undergo sprouting from embryonic veins, such a the perimetanephric, axillary and jugular regions, and in the developing mesenterium. Expressed in adult heart, brain, spleen,
            VEGFR-3, but only the fully processed form could activate VEGFR-2 VEGF-C first form an antiparallel homodimer linked by disulfide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ser-228 producing an heterotetramer. The next extracellular step of the processing removes the N-terminal propeptide. Finally the mature VEGF-C is composed mostly of two VEGF homology domains (VHDB) bound by non-covalent interactions (By similarity). SIMILARITY: BELONGS TO THE PDGF/VEGF FAMILY OF GROWTH FACTORS.

SIMILARITY: BELONGS TO THE METALLOTHIONEIN SUPERFAMILY; FAMILY 13.
                        FUNCTION: Growth factor active in angiogenesis, vasculogenesis and endothelial cell growth. It induces endothelial cell proliferation, promotes cell migration, inhibits apoptosis, and induces permeabilization of blood vessels. It binds to the VEGFR1/Flt-1 and VEGFR2/Kdr receptors and to heparan sulfate and heparin (By similarity).
